Evening
Thanks again

[The whole Earth Archive](#)

We can't put it together.
It is together.

[The whole Earth Catalogue](#)

"Information wants to be free." – Stuart Brand

Whole Earth Catalog created a **peer-to-peer** network that connected and galvanized like-minded people. In doing so, it created a legacy as an early link between the counterculture movement and the cresting personal tech industry.

It spoke to a growing generation of do-it-yourselfers and innovators—particularly, oh, those entrepreneurs who've found themselves in California over the years.

Indeed, Steve Jobs cited the catalog in his 2006 commencement address at Stanford, calling it “sort of like Google in paperback form, 35 years before Google came along.” Its Silicon Valley canonization should also stand as a reminder of the corresponding risks that come with viewing ourselves as gods.

web 1.0:

1989 - 2004

The Telecommunications Act of 1996

- Deregulates cable television service
- Allows local telephone companies to provide
- allows local telephone companies to provide cable television service
- requires v-chips in new televisions, which allow parents to block access to objectionable and adult programming
- increases the number of television stations that a single company may own
- bans the knowing transmission of indecent material to minors on the Internet
- Significantly reduced regulations on media concentration and cross-ownership of media outlets. Less competition, lead to AOL/ Time Warner and Viacom to purchase multiple media outlets in local markets.

browser wars

Account Info:

Name: Scott Pearson, BS
Member Since: January 12, 2005
Last Update: February 3, 2005

Basic Info:

[\[edit\]](#)

Email: pearsons2@scranton.edu
Status: **Alumnus/Alumna**
Sex: **Male**
Year: **2004**
Concentrations: **Computing Sciences
Mathematics**

Phone: **570.499.4818**
High School: **Dunmore HS '00**

Extended Info:

[\[edit\]](#)

Screenname: **ScottiePP7**
Looking For: **Friendship
Dating
A Relationship
Random play
Whatever I can get**

Interested In: **Women**
Relationship Status: **Single**
Political Views: **Liberal**
Interests: **Drinking, Football, Basketball, Tennis,
saying you'll have that**

Interpreted vs. Compiled Programming

Compiled	Interpreted
C++, Java	JavaScript
compiled as machine language	code saved as you write it.
.exe - executable file. Self-standing program	requires library to interpret commands
fast, speed of performance	only language that runs in the browser
Programming language	Scripting language

[document object model]

the Document Object Model

When a browser loads a web page, it creates a model of that page

This is called a "DOM tree" and it is stored in the browser's memory

Every element, attribute, and piece of text in the HTML is represented by its own "DOM node"

The DOM

Every element on a page is accessible in JavaScript through the DOM: Document Object Model

The DOM is the tree of nodes corresponding to HTML elements on a page.

Can modify, add and remove nodes on the DOM, which will modify, add, or remove the corresponding element on the page.

The DOM

The DOM is a tree of node objects corresponding to the HTML elements on a page.

- JS code can examine these nodes to see the state of an element (e.g. to get what the user typed in a text box)
- JS code can edit the attributes of these nodes to change the attributes of an element (e.g. to toggle a style or to change the contents of an `<h1>` tag)
- JS code can add elements to and remove elements from a web page by adding and removing nodes from the DOM

<p>hello</p>

types of DOM nodes

There are four main types of nodes.

- The **Document** node, which represents the entire page : HTML TAG
- **Element** nodes, which represent individual HTML tags
 - **Attribute** nodes, which represent attributes of HTML tags, such as class
- **Text** nodes, which represents the text within an element, such as the *content* of a p tag

We talk about the relationship between element nodes as “parents,” “children,” and “siblings.”

DOM queries

JavaScript methods that find elements in the DOM tree are called “**DOM queries**”

DOM queries may return one element, or they may return a “node list”

Which DOM query you use depends on what you want to do and the scope of browser support required

For Example: JavaScript methods that return a single element node:

`getElementById("potato")`

`querySelector()`
